

VIRTUAL HOSTING

we can host multiple websites through one IPV4

1. install git - **sudo yum install git**
2. install httpd- **sudo yum install httpd**
3. start httpd- **sudo systemctl start httpd**
4. enable httpd- **sudo systemctl enable httpd**
5. git clone <https://github.com/Mani137/food.git>
6. git clone <https://github.com/Prem4638/battleships>
7. **sudo cp -r * /var/www/html**
8. **cd /etc**
9. **cd httpd**
10. **cd conf**
11. **sudo vi httpd.conf**
12. press i
SCRIPT:
<VirtualHost *:80>
DocumentRoot "/var/www/html/food"
</VirtualHost>
<VirtualHost *:80>
DocumentRoot "/var/www/html/battleships"
</VirtualHost>
13. press esc
14. **:wq!**
15. **sudo systemctl restart httpd**
16. copy public ip than paste in browser

17. IPV4:80/food

18. IPV4:80/battleships
